

## SAP Business ByDesign – light package, huge inside

The very first time when I got access to SAP Business ByDesign and I logged in, I was somewhat doubtful and curious at the same time of what I will find. I had no previous knowledge about the SAP Business ByDesign, although I had previous background with other SAP ERP products and they were huge with endless functionalities. With SAP Business ByDesign it was different - you have one navigation menu and this menu has all the work centers (like ECC transactions) and that is it!

Two minutes after logging in the first time I could create a sales order in the system. This was so different to my experience with other ERP products out there. I was able to complete business transactions in the system intuitively without any external help or materials. Things were logical and easy to find and worked as I would assume them to work.

Using the SAP Business ByDesign daily you will start to get a feeling that this product is not so 'small' after all. It seems to be as with this car. Small outside but fits a lot inside.

I soon found out that there are [many](#) business areas covered in SAP Business ByDesign which include manufacturing, accounting & controlling, procurement etc. SAP Business ByDesign is full size ERP and can solve so large variety of business challenges of a mid-size company with ease!

I learned that the business processes are still highly customizable as you would expect from a solid SAP product. There is a smooth integration between business processes and the data in the system. The document flow will help You at every step to go back or forth between different documents. The built-in business analytics enables to get quick insights about the figures in the system.

There are other great things about SAP ByDesign also, which are not just the business functionalities. I have written about them in my blog [post](#). Some of them are MS Excel integration, regular updates 4 times a year, SAP idea forum, API-s and more. You can read more about them from the [post](#).

## Conclusion

Now, after using SAP Business ByDesign for a while, I still discover new features there. I find the solution using very good business practices, which are easy and intuitive for the end user. I believe that the system is future proof as its already natively web based, its connectable via [200+ Web API-s](#) to other applications or Internet-of-Things, its extendable by [70+ integration scenarios](#) or the SAP cloud application studio.

I now think that SAP Business ByDesign is a large and good product and I am a fan of it!
